

Homework 5: Semantics of Arithmetic Expressions

CIS 352: Programming Languages

15 February 2018, Version 2

Administrivia

- You **may** work in pairs on this assignment.
- *However*, to get some practice for future quizzes, everyone should work on the first three problems on their own.
- For Part I, hand written answers are fine, **but make them readable**.
- For Part II, copy all the files in <http://www.cis.syr.edu/courses/cis352/code/L1/> and use `eval1.hs` as your starter file.
- **To turn Part I:** Place your papers in the CIS 352 box on the 4th floor of SciTech by the due date.¹
- **To turn Part II:** Submit via Blackboard (i) the source files for Part II, (ii) the transcripts of test runs, and (iii) the cover sheet.

Part I: Problems on Paper

❖ Problem 1 (18 points) ❖

Give a complete big-step derivation of each of the following.²

- (a) $((1 + 2) * 3) \Downarrow 9$
- (b) $(1 + (2 * 3)) \Downarrow 7$
- (c) $(5 + ((6 - 2) * (3 + 4))) \Downarrow 33.$

❖ Problem 2 (18 points) ❖

Give a complete small-step derivation of each transition below.²

- (a) $((5 - 3) * 2) \rightarrow (2 * 2)$
- (b) $((4 + (7 * 2))/5) \rightarrow ((4 + 14)/5)$
- (c) $((12 + ((5 - 3) * 2)) * (8 + 1)) \rightarrow ((12 + (2 * 2)) * (8 + 1))$

❖ Problem 3 (14 points) ❖

Give a complete transition sequence to a value for each of the following expressions.³

- (a) $((6 + (7 * 2))/5) \rightarrow^* 4$
- (b) $((12 + ((5 - 3) * 2)) * (8 + 1)) \rightarrow^* 144$

Grading Criteria

- The homework is out of 100 points.
- Each programming problem is $\approx 70\%$ correctness and $\approx 30\%$ testing.
- Omitting your name(s) in the source code loses you 5 points.

¹ The papers are collected Saturday morning.

Fair warning: Questions like Problems 1, 2, and 3 *will* show up on quizzes.

² **Rules reference.** The big-step and small-step evaluation rules are given in Appendices on page 4. Unlike the rules on some of the class slides, the rules Appendices conflate numerals and integer-values to cut some clutter in derivations.

³ You *do not* need to give a small-step derivation for each step in the transition sequence

❖ **Problem 4 (20 points)** ❖

Suppose we add the following new sort of arithmetic expression to our language:

$$(E_1 ? E_2 : E_3)$$

This expression is based on the conditional expression from the C programming language, whose evaluation Kernighan and Ritchie describe as follows⁴:

In the expression

$$expr_1 ? expr_2 : expr_3$$

the expression $expr_1$ is evaluated first. If it is non-zero . . . , then the expression $expr_2$ is evaluated, and that is the value of the conditional expression. Otherwise $expr_3$ is evaluated, and that is the value. Only one of $expr_2$ and $expr_3$ is evaluated.

⁴ Brian W. Kernighan and Dennis M. Ritchie. *The C Programming Language*, 2nd ed. Prentice Hall Software Series, 1988, page 51.

Example:

$$\begin{aligned} (10 ? 6 * 5 : 17) &\rightsquigarrow 30 \\ (0 ? 6 * 5 : 17) &\rightsquigarrow 17 \end{aligned}$$

- (a) Extend the definition of \Downarrow to account for conditional expressions of this form.⁵
- (b) Using your new rule(s), give a formal derivation of:

$$((23 + 7) ? (9 - 4) : (3/0)) \Downarrow 5$$

Explain why the evaluation does *not* cause a divide-by-zero error.

⁵ **Giant hint:** Figure out how to fill in the blanks (i.e., the *???*'s) in the partial definitions of $COND_0$ and $COND_1$ in Appendix A below.

Part II: Programming Problems

This part consists of two modest extensions of `eval` in the `eval1.hs` file. You are responsible for a reasonable set of tests for both extensions.

❖ **Problem 5 (10 points)** ❖

- (a) (6 pts) Extend the definition of `eval` to handle division per the big step rules. Note that for `(Div a1 a2)`, if `a1` evaluates to v_1 and `a2` evaluates to $v_2 \neq 0$, then the value of `(Div a1 a2)` should be `(div v1 v2)` where `div` is the standard Haskell integer division function. In the case where you have a division by 0, supply your own error message.
- (b) (4 pts) Devise and run a reasonable set of tests for this extension.

❖ *Problem 6 (20 points)* ❖

- (a) (12 pts) Extend the definition of `eval` to handle conditional expressions per your answer to Problem 4 above. Be sure that no division by 0 error occurs when evaluating either of:
- $(1 \text{ ? } 10 : (1/0))$
 - $(0 \text{ ? } (1/0) : 20)$
- (b) (8 pts) Devise and run a reasonable set of tests for this extension.

Part III: Challenge Problems⚡ *Challenge Problem 1: (No points, just glory).* ⚡

Provide reasonable small-step rules for conditional expressions.

⚡ *Challenge Problem 2: (No points, just glory).* ⚡

Automate the construction of small-step derivations and complete transition sequences.

Appendices

Key

a : an arithmetic expression

v : a numeric value

Reference: Big Step Rules

$$\begin{array}{ll}
 \text{PLUS: } \frac{a_1 \Downarrow v_1 \quad a_2 \Downarrow v_2}{(a_1 + a_2) \Downarrow v} (v = v_1 + v_2) & \text{NUM: } \frac{}{v \Downarrow v} (\mathcal{N}[\llbracket n \rrbracket] = v) \\
 \text{MINUS: } \frac{a_1 \Downarrow v_1 \quad a_2 \Downarrow v_2}{(a_1 - a_2) \Downarrow v} (v = v_1 - v_2) & \text{COND}_0: \frac{??? \quad ???}{(a_1 ? a_2 : a_3) \Downarrow v} (???) \\
 \text{MULT: } \frac{a_1 \Downarrow v_1 \quad a_2 \Downarrow v_2}{(a_1 * a_2) \Downarrow v} (v = v_1 * v_2) & \text{COND}_1: \frac{??? \quad ???}{(a_1 ? a_2 : a_3) \Downarrow v} (???) \\
 \text{DIV: } \frac{a_1 \Downarrow v_1 \quad a_2 \Downarrow v_2}{(a_1 / a_2) \Downarrow v} \left(\begin{array}{l} v_2 \neq 0 \ \& \\ v = \lfloor v_1 / v_2 \rfloor \end{array} \right)
 \end{array}$$

A sample big-step derivation

$$\begin{array}{c}
 \text{NUM: } \frac{}{2 \Downarrow 2} \quad \text{NUM: } \frac{}{5 \Downarrow 5} \quad (2 + 5 = 7) \quad \text{NUM: } \frac{}{13 \Downarrow 13} \quad (7 * 13 = 91) \\
 \text{PLUS: } \frac{}{(2 + 5) \Downarrow 7} \quad \text{MULT: } \frac{}{((2 + 5) * 13) \Downarrow 91}
 \end{array}$$

Reference: Small Step Rules

$$\begin{array}{lll}
 \text{plus}_1: \frac{a_1 \rightarrow a'_1}{(a_1 + a_2) \rightarrow (a'_1 + a_2)} & \text{plus}_2: \frac{a_2 \rightarrow a'_2}{(v_1 + a_2) \rightarrow (v_1 + a'_2)} & \text{plus}_3: \frac{}{(v_1 + v_2) \rightarrow v} (v = v_1 + v_2) \\
 \text{minus}_1: \frac{a_1 \rightarrow a'_1}{(a_1 - a_2) \rightarrow (a'_1 - a_2)} & \text{minus}_2: \frac{a_2 \rightarrow a'_2}{(v_1 - a_2) \rightarrow (v_1 - a'_2)} & \text{minus}_3: \frac{}{(v_1 - v_2) \rightarrow v} (v = v_1 - v_2) \\
 \text{mult}_1: \frac{a_1 \rightarrow a'_1}{(a_1 * a_2) \rightarrow (a'_1 * a_2)} & \text{mult}_2: \frac{a_2 \rightarrow a'_2}{(v_1 * a_2) \rightarrow (v_1 * a'_2)} & \text{mult}_3: \frac{}{(v_1 * v_2) \rightarrow v} (v = v_1 * v_2) \\
 \text{div}_1: \frac{a_1 \rightarrow a'_1}{(a_1 / a_2) \rightarrow (a'_1 / a_2)} & \text{div}_2: \frac{a_2 \rightarrow a'_2}{(v_1 / a_2) \rightarrow (v_1 / a'_2)} & \text{div}_3: \frac{}{(v_1 / v_2) \rightarrow v} \left(\begin{array}{l} v_1 \neq 0 \ \& \\ v = \lfloor v_1 / v_2 \rfloor \end{array} \right)
 \end{array}$$

A sample small-step derivation

$$\begin{array}{c}
 \text{minus}_3: \frac{}{(8 - 3) \rightarrow 5} (5 = 8 - 3) \\
 \text{plus}_2: \frac{}{(6 + (8 - 3)) \rightarrow (6 + 5)} \\
 \text{mult}_1: \frac{}{((6 + (8 - 3)) * (5 - 2)) \rightarrow ((6 + 5) * (5 - 2))}
 \end{array}$$

A sample complete small-step transition sequence

$$((6 + (8 - 3)) * (5 - 2)) \rightarrow ((6 + 5) * (5 - 2)) \rightarrow 11 * (5 - 2) \rightarrow 11 * 3 \rightarrow 33$$
